

# WASTE MANAGEMENT™

*Tomorrow's Integrated Information Systems*

The Keystone Waste Management module enables your landfill attendant to create tickets for waste disposed of at your landfill site. The tickets record who dropped off the waste, where it came from as well as the quantity and type of waste.

This module is fully integrated with the Cash Receipts, Accounts Receivable and General Ledger modules so tickets created at the landfill site can then be imported into the financial system where deposit batches and batches of accounts receivables can be created and posted through to the general ledger.

- You have the ability to define multiple waste disposal sites
- Create a rate table specifying all waste types and the related rate
- Specify which customers can charge and which ones are required to pay at the time of disposal
- Track vehicle information for vehicles dropping off waste
- Record gross and tare weights enabling the system to calculate the weight of waste left at the site
- For mixed loads, specify the percentage of each waste type and let the system pro-rate the weight and calculate the associated charges
- Produce a ticket/receipt using a receipt printer
- Import cash receipts/charged tickets into the financial system and automatically create cash receipt deposit batches and accounts receivable invoice batches
- Track collection of charged tickets through the accounts receivable module
- A variety of reports provide you with the detailed information you require to comply with MOE reporting requirements as well as detailed financial information
- Optional weigh scale interface is available
